Student Responses

Answer the following questions

Question 1

Comment out the asm line. Run the program again to see what would happen. What do you observe that happens differently than before :

The program functions identically, but the loop runs constantly since there is no 5 second interrupt as before.

Question 2

In terms of CPU power consumption, what difference does the asm statement make?

Without the asm statement the CPU executes the loop continuously at the full clock speed, this in turn will consume more power. With the

asm statement, we issue a wait for interrupt, where we put the ARM core into a sleep mode which will consume less power.
